

Delphix Release 5.3.6

Introducing Delphix 5.3.6 - EBS Enhancements

On behalf of the product and engineering teams, I'm pleased to announce that 5.3.6 is generally available as of 10/10/2019.

Note that customers must upgrade to 5.3.6 or a later 5.3.x release before they will be able to upgrade to the forthcoming 6.0 release.

Here are the most important highlights in this release that I encourage you to become familiar with and engage on with customers and prospects:

High Level Update

This release consists of technical changes that will improve the efficiency and ease of use for Delphix customers working with Oracle EBS. In addition, this release includes numerous bug fixes and one new platform certification (RHEL 8/ASE 16).

Technical Update

CLEARING PROVISION FAILURES IN ORACLE EBS

Delphix users can now clear or ignore EBS provision failures with adcfgclone since the failures are not show stoppers. Prior to this release, users would receive error messages from provision failures that would unnecessarily clutter up the UI because they could not be cleared.

CHANGE EBS TITLE ON PROVISION/REFRESH AUTOMATICALLY

Delphix will automatically change EBS title on provision and refresh, with no need for manual work. Prior to this release, the EBS title would revert back to the default title on VDB provision and refresh, which required manual intervention to change via hooks.

For detailed information on any of the above items, please refer to the release notes,
